

Module 15 – Prompt Automation

Topics: Chaining, Workflows, APIs, Scaling

Assignment: Automated System Banao

Is assignment mein ek aisa automated AI content system banaya gaya hai jo ek topic receive karta hai aur us topic se social media post tak ka kaam multiple AI steps ke zariye automatically complete karta hai.

1. Automated System ka Idea

System Name: AI Content Automation System

Is system ka purpose yeh hai ke user sirf topic de, aur system us topic par idea, outline, content, caption aur final post tayar kar de. Is se manual kaam kam hota hai aur ek hi process ko baar baar repeat kiya ja sakta hai.

2. System ka Basic Workflow

Step	Kaam
1	User topic enter karta hai
2	AI topic ko analyze karta hai
3	AI content outline banata hai
4	AI outline se detailed content likhta hai
5	AI content ko edit aur improve karta hai
6	AI social media caption aur hashtags banata hai
7	Final content save/publish karne ke liye ready hota hai

3. Prompt Chaining

Prompt chaining ka matlab hai ke ek hi prompt mein sara kaam karne ke bajaye task ko chhote prompts mein divide kiya jaye. Har step ka output aglay step ka input ban jata hai.

Chain	Prompt ka Kaam	Output
Prompt 1	Topic ko samajhna	Topic analysis
Prompt 2	Analysis se outline banana	Content outline
Prompt 3	Outline se content likhna	Draft content
Prompt 4	Draft ko improve karna	Final content
Prompt 5	Final content se caption banana	Caption + hashtags

4. Workflow Automation

Workflow mein tamam steps ek fixed order mein automatically run honge. Misal ke taur par:

- Input: User topic deta hai — 'Healthy Study Habits'.
- Step 1: AI topic ka purpose aur audience identify karta hai.
- Step 2: AI 5 main points ki outline banata hai.
- Step 3: AI outline ko detailed article mein convert karta hai.
- Step 4: AI grammar, clarity aur structure check karta hai.
- Step 5: AI short caption aur relevant hashtags banata hai.
- Output: Final article + caption + hashtags ready.

5. APIs ka Use

API ek system ko doosray software ya online service ke sath connect karne ka tareeqa hai. Automated system mein API ke zariye AI model, database, email service ya publishing tool ko workflow ke sath connect kiya ja sakta hai.

API / Service	Possible Use
AI API	Prompt bhejna aur AI ka response lena
Database API	Topics aur generated content save karna
Email API	Final content email karna
Social Media API	Supported platform par post publish karna

6. Scaling

Scaling ka matlab hai ke system ko zyada users, topics ya requests handle karne ke liye expand karna. Agar pehle system 10 topics daily process karta hai to automation aur proper infrastructure ke zariye isay zyada workload ke liye design kiya ja sakta hai.

- Multiple requests ko queue mein process karna.
- Repeated prompts ko reusable templates mein rakhna.
- Database mein generated content ko organize karna.
- Error aaye to automatic retry ya human review rakhna.
- API limits aur cost ko monitor karna.

7. Complete Automated System Diagram

User Input → AI Analysis → Outline → Content Generation → Editing/Quality Check → Caption & Hashtags → Database/Publishing → Final Output

8. Example

Input Topic: 'AI ke Students ke Liye Benefits'

Automated Output: System topic ko analyze karega, outline banayega, short article generate karega, grammar check karega, phir social media caption aur hashtags create karega. Final result ko database mein save kiya ja sakta hai.

9. System ke Benefits

- Time save hota hai.
- Repeated work automatically ho jata hai.
- Content creation ka process organized rehta hai.
- Human errors kam kiye ja sakte hain.
- Same workflow ko large scale par use kiya ja sakta hai.

10. Conclusion

AI prompt automation mein chaining, workflows, APIs aur scaling important concepts hain. Prompt chaining se complex task ko chhote steps mein divide kiya ja sakta hai, workflow se steps ko automate kiya ja sakta hai, APIs different tools ko connect karti hain aur scaling system ko zyada workload handle karne ke qabil banati hai. Is tarah ek simple AI prompt ko complete automated system mein convert kiya ja sakta hai.
